

Real-Time Drivers Fatigue Detection: Sensing, Analysis and Alarming

In this book, the methods of drivers fatigue detection have been studied. Furthermore, we explain the process of designing an analysis method based on fuzzy logic theory using three types of factors to detect the drivers fatigue: Driver crucial factors, Environmental factors and Conditional factors. In the proposed method using tactile and environmental sensors, the system predicts drivers fatigue before s/he falls asleep and concentrates the driver attention by alarming. This system helps the driver to keep his/her alertness during driving. An advantage of the proposed fatigue detection method is that it does not interfere with the drivers habit in vehicle control and it resumes functioning only in critical moments.
