

Atlas of Polymer and Plastics Analysis: Defined Polymers Vol 1 (English and German Edition)

Enlarged and completely revised, Volume 1 of the third edition of Hummel contains almost 2800 FT-IR spectra, largely of new polymers. All spectra are presented with information on source, preparation, structural and molecular formulas, decimal numbers and an extensive bibliography. From a review of the second edition: My first impression after scanning through the volumes was that this is an amazing reference work. Each volume has an extensive bibliography. The spectra are very well recorded, even for materials where sample preparation must have been very difficult. The decimal classification used in the Atlas is a brilliant and complete system for classifying polymers... (this Atlas) must be the best presented and most up-to-date reference available. Polymer Division Newsletter D.O. Hummel, Professor of Physical Chemistry at the University of Cologne, FRG, has written several books in the field of polymers and plastics which have found international renown. Professor Hummel is one of the polymer gurus for polymer scientists worldwide. This spectral library with all additional information is also available in electronic form by Chemical Concepts. Please inquire for Hummel Infrared Standards. See the following homepage for more information:
