

Thermodynamic Properties of Gases

The book gives the thermodynamic properties of air, nitrogen, oxygen, hydrogen, water vapor and other gases reduced to the ideal state in the temperature range from -50 to +1500 C. The tables have been computed using interpolation equations proposed by the author, which are suitable for computer-aided calculations. The method of construction of thermal diagrams for products of combustion of various fuels is described. The book is intended for design and research organizations, engineering and technical personnel of power stations and factories and also for students of higher and secondary educational institutions.
